Comprehensive Risk Disclosure & Warning Statement

Statutory Notice on the Speculative Nature and Capital Hazards of Digital Derivative Trading

DOC REF: STX-DIS-RSK-2026-V5 | STANDARD REGULATORY SPECIFICATION | EFFECTIVE: 2026 EDITION

1. General Provisions & Statutory Risk Warning

CRITICAL REGULATORY NOTICE: Trading in foreign exchange (Forex), cryptocurrencies, stock indices, commodities, and short-term digital option derivative contracts carries a very high level of financial risk and may not be suitable for all investors. The high degree of price sensitivity can work both for and against you. There is an inherent possibility that you may sustain a total loss of your deposited capital. You should never invest money that you cannot afford to lose entirely.

1.1. This Risk Disclosure Statement (the "Disclosure") is provided by StarX Options Global (the "Company") to inform all prospective and active Clients of the significant financial hazards, operational vulnerabilities, and technical risks inherent in executing speculative derivative transactions.

1.2. Registration on the Company's platform, funding of an account, and submission of trading orders constitute unequivocal legal confirmation that the Client has read, comprehended, and voluntarily accepted every risk outlined within this document.

1.3. This Disclosure is for informational, educational, and governance purposes and does not constitute financial, investment, legal, or tax advice. The Company urges all Clients to consult independent qualified financial advisors prior to deploying risk capital.

2. Purpose & Educational Intent of this Disclosure

2.1. The primary purpose of this Disclosure is to ensure that the Client approaches trading with realistic expectations, prudent capital allocation strategies, and an acute awareness of the mathematical probabilities governing digital contract markets.

2.2. The Client must recognize that digital contracts are short-duration, high-velocity derivative instruments designed for speculative risk management, not capital preservation or guaranteed returns. Past performance, historical chart backtesting, or marketing simulations provide zero guarantee of future outcomes.

3. Market Volatility & Rapid Price Fluctuations

3.1. Financial markets are subject to unpredictable, violent price swings driven by geopolitical tensions, macroeconomic announcements (such as Non-Farm Payrolls, GDP releases, and central bank interest rate decisions), governmental interventions, and unexpected black-swan events.

3.2. Market Gaps & Illiquidity: Between market sessions or during periods of extreme macroeconomic volatility, asset prices may "gap" (shift instantaneously from one price level to a significantly different quote without trading across intermediate ticks). Such volatility can render directional forecasts inaccurate.

3.3. Fixed-Payout Mathematical Realities: Digital contracts feature a predefined, asymmetric payout structure where a winning contract yields a return typically between 80% and 98%, whereas an unsuccessful contract results in the loss of 100% of the invested stake. Consequently, maintaining long-term account profitability requires an established win rate consistently above 53% to 56%.

4. Technical, Network & Client-Side Risks

4.1. Hardware & Operating System Risks: The Client is solely responsible for maintaining the security, integrity, and performance of their trading devices (computers, smartphones, and tablets). Hardware failures, malware infections, operating system freezes, or screen input errors originate on the Client side and cannot be compensated by the Company.

4.2. Telecommunications & Internet Connectivity: Digital option trading demands continuous, ultra-low-latency data exchange. Fluctuations in client internet connections, cellular signal drops, local ISP routing degradation, or mobile browser background throttling can cause delay between the Client clicking an order button and the server receiving the instruction.

4.3. Browser Cache & Rendering Latency: Outdated browser caches or unaccelerated graphic drivers may cause visual chart desynchronization on the Client terminal. The Client acknowledges that execution is governed strictly by the central matching engine's server timestamp, not the visual state rendered on the local browser.

5. Quotation, Liquidity & Execution Risks

5.1. Spread & Midpoint Execution: The Company utilizes institutional midpoint pricing derived from multiple Tier-1 liquidity aggregator feeds. Quotes displayed in the terminal may differ marginally from retail spreads quoted on third-party charting platforms (such as TradingView or MetaTrader) due to differences in data aggregation mechanisms.

5.2. Slippage & Order Rejection: In conditions of extreme illiquidity or ultra-fast market movement, an order submitted at a specific displayed price may be rejected if the quote has shifted before packet arrival at the matching engine.

6. Over-The-Counter (OTC) Synthetic Instrument Risks

6.1. During weekends and global holiday closures, trading on select instruments is conducted Over-The-Counter (OTC). While OTC instruments adhere to deterministic, cryptographically seeded stochastic algorithms, their price trajectories do not mirror live physical market exchanges during those periods.

6.2. The Client undertakes to understand the distinct algorithmic nature of OTC markets and trade OTC assets with appropriate capital moderation.

7. Psychological & Prudent Capital Management

7.1. Trading speculative instruments can induce severe psychological pressure, emotional distress, and cognitive biases, including impulsive decision-making, "revenge trading" following losses, and over-leveraging.

7.2. Golden Rules of Responsible Capital Allocation:

- Never risk capital earmarked for essential living expenses, mortgages, healthcare, or family sustenance;
- Allocate no more than one percent (1%) to five percent (5%) of your total account balance to any single trading contract;
- Establish daily stop-loss and profit targets and cease trading upon reaching predefined risk limits;
- Never attempt to recover trading losses by doubling contract sizes in irrational market states.

8. Jurisdictional, Legal & Cross-Border Restrictions

8.1. The legality of online digital option trading varies across global jurisdictions. It is the sole, exclusive responsibility of the Client to ascertain whether accessing the platform complies with the laws, financial directives, and tax regulations of the Client's country of citizenship or physical presence.

8.2. Prohibited Jurisdictions: The Company strictly prohibits the registration of accounts, deposition of funds, or placement of trades by citizens or residents of the United States of America, Canada, European Economic Area (EEA) member states, Israel, Hong Kong, the United Kingdom, and jurisdictions subject to international sanctions. Any account established from prohibited jurisdictions through deceptive VPN usage will be terminated immediately.
